

Andrew Sklyarov

Senior ObjectScript Developer | Interoperability Expert

 Hua Hin, Thailand / Tel.: +66 0968202307 / E-mail: iris79119760730@gmail.com / [LinkedIn](#) / [GitHub](#)

SUMMARY

I consider myself an expert in integration development with IRIS Interoperability (Ensemble). My core skills include developing ETL processes, transforming data between protocols and formats, normalizing and enriching data. In addition, I have extensive experience in database modeling on the Caché platform and API development, from specifications to unit testing. I develop high-load, mission-critical software on the InterSystems IRIS Data Platform. My Caché ObjectScript programming experience includes hundreds of data flows, thousands of business hosts, dozens of APIs, and many complete solutions in different domains. I have integrated applications such as SAP S/4HANA, Oracle Siebel, SAP Commerce Cloud, POS solutions, data warehouses, and others into the solid IT infrastructure using the IRIS Data Platform. I also have expertise in related areas, including SQL, Java, Embedded Python, mobile development, IRIS management, DevOps, and Apache Kafka.

SKILLS

IRIS Platform | IRIS for Health | Interoperability | Caché ObjectScript | MUMPS | API | ESB | Java | SQL | Docker | Apache Kafka | Mobile

PROFESSIONAL EXPERIENCE

InterSystems Corp Software Company

 London, UK

Senior Backend Developer (Dec 2025 - Present)

In this role, I work as a backend developer on InterSystems' internal web projects, such as Developer Community Ecosystem: Open Exchange, Global Masters, Startup Hub and others. We use InterSystems IRIS as a backend API and database platform. Here are a few tasks that I completed:

- Creation of an OpenAPI specification for our API (contains over 120 endpoints) + validating all incoming requests + fully covering unit tests. I used YAML, %UnitTest Framework, and Embedded Python. This has greatly simplified the interaction between the frontend and backend teams
- Optimization of the GM main page load (replacing the approach of multiple database queries with a single query and post-processing in the controller). Achieved a loading speed increase of over 40%
- Development of a sub-system of user email subscriptions. Features include user settings, Interoperability flow with guaranteed delivery of messages, message templates (using the Jinja engine), mailing companies, and more. Benefits: Fast and affordable integration with current and future web projects, a reliable channel of communication with the community and company's clients
- Developing a version control module that provides full control and audit of how, when, and what exactly was changed in the database. This solution helps the company maintain data consistency and ensure a high level of access control

Aroma Tech Omni-Channel Retail Company

 Saint-Petersburg, Russia

Senior Software Engineer & Software Architect (Feb 2013 – Present)

In this company, I created the largest InterSystems IRIS implementation as the ESB (Enterprise Service Bus). My codebase, principally in ObjectScript (I also use Java and Python), comprises 800+ data flows, API endpoints, and clients for external APIs. Over 50 systems are integrated into a single ecosystem on the IRIS cluster using mirroring technology. The system handles up to 400 RPS of inbound requests and transmits ~3 TB of messages weekly.

The largest projects, where I was involved in different roles (as Developer, Team Lead, and Software Architect):

- Loyalty programs processing (SOAP API): more than 1000 POS terminals, up to 350 RPS, 24/7 availability; backend - Oracle Siebel CRM, frontend - Set Retail 10, transport layer - InterSystems Ensemble
- Implementation of SAP products, such as SAP S/4HANA, SAP Commerce Cloud (formerly Hybris), SAP Marketing: on the IRIS side, I developed a server and client for IDoc processing based on SAP JCo lib (Java), and built many data flows, also using SOAP, REST APIs, and JDBC protocol
- Migration legacy Ensemble Caché to InterSystems IRIS 2024: deployed mirrored failover, achieved zero message loss, and maintained 99.9% interface availability
- Implementation of modern approaches for ObjectScript development, including the use of GitHub Flow, code review, AI-assisted coding, unit testing with Mock Server APIs (Postman), auto-deployment, and so on. As a result, a significant reduction in the number of errors was achieved
- IRIS ESB project: guaranteed delivery of messages, message validation, flexible API to receive any message types, centralized monitoring/alerting, and integration code
- Integration with marketplaces using the IRIS Data Platform. Such as Amazon, Sbermarket, Ozon, Wildberries, etc. Mainly, this was transferring JSON data over REST APIs

I'm also responsible for IRIS administration, troubleshooting, resolving information transmission issues, and optimizing processes. I lead a team (up to 3 engineers), including mentoring, training, code reviews, etc.

Senior Software Engineer (Jan 2025 - Dec 2025)

Fixed-term project. Development of a high-load application on the InterSystems IRIS 2024 for use as an integration layer and as a report generator for state regulators. I have worked on implementing the following tasks (using ObjectScript/Python):

- Load raw data from Apache Kafka topics (up to 7000 RPS)
- Decoding from the Protobuf format and normalizing data
- Converting messages into Avro format and uploading to other Kafka clusters
- Integration with AtScale via API
- Design and implementation of API on the IRIS side
- Creating project documentation
- Unit test development

EDUCATION

Platov South-Russian State Polytechnic University
Bachelor's degree

 Russia

- Information Technology

ADDITIONAL INFORMATION

- Languages: English (Intermediate), Russian (Native)
- Time zone: Bangkok, GMT +7
- Active member of the community
- One of the winners of the InterSystems Developer Tools Contest 2025
- Third place in the InterSystems Technical Article Contest 2026

In addition to my current interests in InterSystems IRIS and application integration in general, I was a 1C Enterprise developer and ranked among the TOP 10 developers on the 1C community portal. I was a successful indie game developer. My games repeatedly appeared in the Featured section on Google Play and the App Store. They have been downloaded over 27 million times. I am always looking for ways to be better, developing skills in new areas such as Java, Flutter (Dart), or Python within my own projects.
